# PVA PDF Toolkit
For OPENTEXT Content Server 10.x and Livelink 9.7.x

The PDF Toolkit bundles our three most popular PDF tools. They integrate the power of Appligent's software with Content Server (CS).

AppendPDF — Publish a Single PDF from Multiple Files

Integrates with Appligent AppendPDF™ software to allow users to create a single PDF file from multiple PDF files in a controlled order. The module maintains the relationship of the master and the components, and can be regenerated if any of the components have been changed. It speeds up the publishing process, and allows the generation of a single table of contents and bookmarks for the merged documents.

FDFMerge — Publish Workflow Form Data to CS/Livelink as a PDF

Integrates the Appligent FDFMerge™ software with Content Server/Livelink workflow forms. This integration module gives Content Server the ability to convert a Workflow Form into a PDF document and store that document within the repository.

Watermark — Stamp Data onto PDF files in CS/Livelink

Integrates with Appligent StampPDF software or the Open Text eSign module to automatically watermark PDF documents. Users can apply watermarks of any kind – page numbers, dates, disclaimers, Content Server attributes, etc. – in multiple styles, colors, and positions. The Watermark module is an essential tool to help your business comply with regulatory and process requirements. The Open Text Renditions module is required for Watermark.
